INTRODUCTION

- Welcome to the presentation on "**Foodzy Food Ordering Web App**" an innovative platform that has transformed the way we order and enjoy food.
- **Foodzy** is a **user-friendly** and intuitive **web application** that brings a wide array of restaurants, cafes, and eateries right to your fingertips.
- Security is paramount, and Foodzy offers various safe and **secure payment options** for a worry-free ordering experience.
- Enjoy great savings with frequent **discounts, deals, and promotional offers**, making dining more affordable and enjoyable.
- Share and explore dining experiences with the **Foodzy community** through **ratings and reviews**, discovering new culinary delights.

OBJECTIVE

- The main objective of our "**Foodzy Food Ordering Web Application**" project is to create a fully functional and scalable food ordering Platform that provides a seamless Ordering experience to users.
- Showcase how **Foodzy** contributes to the overall dining experience by providing **discounts, deals**, and promotional **offers**.
- Communicate the importance of **user-friendly interfaces** and seamless navigation to ensure a smooth and enjoyable ordering process.
- Integrate a reliable **payment gateway** to handle online transactions securely.

TECHNICAL REQUIREMENTS

MongoDB

Setup a **MongoDB** Database to store user information and order details securely.

ExpressJS

Implement **ExpressJS** as the Backend Framework to handle server-side logic and API Development.

ReactJS

Utilize **ReactJS** for building a dynamic and responsive user interface on the frontend.

NodeJS

Develop **NodeJS** based server-side code to manage server operations and database interactions.

SOME IMPORTANT NPM PACKAGE

A X I O S

Axios is a popular npm package used for making HTTP requests from the front-end to the server. In our Foodzy web App, we utilize axios to fetch data from the back-end API, such as retrieving product details, categories, and user information

This npm package is essential for handling routing in a React-based application. It enables smooth navigation between different pages and components without the need for full-page reloads. In our project, we utilize react-router-dom to manage routes for product details, cart, checkout, and user authentication.

Nodemon is a useful npm package for development, especially during the testing phase. It automatically restarts the server whenever changes are made to the codebase, enhancing the development workflow and speeding up iterations.

Mongoose is an object data modeling (ODM) library for MongoDB. In our project, we utilize mongoose to define and interact with the MongoDB database schema and perform CRUD operations on user data, product data, and order details.

Mongoose {  }

FUNCTIONALITY OF FOODZY

Foodzy Food Ordering Web Application aims to enhance the user experience and provide convenient access to personalized information. It allows registered users to manage their profiles, view past orders, and access relevant account details, making the ordering process more efficient and personalized.

- **User Registration and Login:** Users can create an account or log in to Foodzy using their credentials, ensuring a secure and personalized experience.

- **User Profile Management:** Once logged in, users can access and update their profile information, such as name, contact details, and delivery address. This feature allows for easy maintenance of personal information without the need to re-enter it during each order.

- **Order History:** Users can access a comprehensive order history, displaying details of their past orders, including the date, time, restaurant, items ordered, and total cost. This feature helps users keep track of their dining habits and easily reorder their favorite meals.

- **Order Status and Tracking:** Users can view the status of their current orders, such as "confirmed," "preparing," "out for delivery," or "delivered." Real-time order tracking provides users with a sense of assurance and anticipation.

- **Rating and Reviewing Orders:** After receiving their orders, users can rate and review the dishes and overall restaurant experience, contributing to the Foodzy community and helping other users make informed choices.

- **Security and Privacy:** The User Profile and Order History functionality ensures the security and privacy of user information, employing encryption and authentication measures to protect sensitive data.

- **Password Reset and Account Recovery:** In case of a forgotten password, users can initiate a password reset process to regain access to their accounts securely.

- **Order History Filtering and Sorting:** Users can filter and sort their order history based on different criteria, such as date, restaurant name, or order total, making it easier to find specific orders quickly.

USER INTERFACE

Why Foodzy?

Tasty food delivery is a convenient way to enjoy your favorite meals without leaving your home. With a variety of options available, from gourmet to fast food, you can satisfy your cravings with just a few clicks.

Fresh and tasty foods
food lovers choose their favorite foods delivered straight to them.

Quality Support
Get the best food from the world's top chefs.

Order from any location
Food that always arrives hot and on time.

ER-DIAGRAM

The Entity Relationship Diagram (ER Diagram) visually represents the entities and their relationships in the database structure of our **"Foodzy Food Ordering Web App Using MERN Stack"** project.

DATA FLOW DIAGRAM

The **Data Flow Diagram (DFD)** showcases the flow of data within the **Foodzy** Web Application system, highlighting how information moves between various components.

DFD Level - 0

DFD Level 1 provides a more detailed breakout of pieces of the Context Level Diagram. This DFD describes main functions carried out by the system, as we break down the high-level process of the Context Diagram into its sub-processes.

DFD Level - 1

The **DFD 2 Level** describes flow of data in more detail. DFD Level 2 goes one step deeper into parts of Level 1. It may require more text to reach the necessary level of detail about the system's functioning.

FUTURE ENHANCEMENTS

Our "Foodzy Food Ordering Web Application Using MERN Stack" project is designed with scalability in mind, allowing for future enhancements and improvements. Here are some potential areas for further development:

Develop a dedicated mobile application to provide users with a convenient and optimized Food Ordering experience on their smartphones.

MOBILE APPLICATION

Allow users to place orders together with friends or family members, supporting group ordering and enabling split payments for shared orders

**GROUP ORDERING AND
SPLIT PAYMENTS**

Enhance the order tracking feature to include real time tracking using GPS, enabling users to monitor the exact location of their delivery and estimated time of arrival.

**REAL-TIME ORDER
TRACKING**

PROJECT TIMELINE

01

PLANNING & RESEARCH MAR/23

- Define project scope and objectives.
- Conduct market research and competitor analysis.
- Identify technical requirements and select the MERN stack for development

02

FRONTEND DEVELOPMENT MAR/29 TO APR/25

- Develop responsive user interfaces using React.js.
- Implement product listing, product details, shopping cart, and checkout functionalities.
- Incorporate user authentication and registration processes

03

DATABASE DESIGN & SETUP APR/26 TO APR/30

- Design the database structure and entity relationships.
- Set up MongoDB database and create collections for users, products, categories, orders, etc.
- Implement database integration with the back-end.

04

BACKEND DEVELOPMENT MAY/01 TO JUN/25

- Set up the Node.js and Express.js server environment.
- Create API endpoints for handling user authentication, product data retrieval, and order processing.
- Integrate third-party payment gateway for secure online transactions.

05

TESTING & DEBUGGING JUN/26 TO JUL/10

- Conduct comprehensive testing, including unit tests, integration tests, and user acceptance tests.
- Identify and fix any bugs or issues to ensure smooth functionality.
- Perform user testing to gather feedback and make necessary improvement

06

DEPLOYMENT & LAUNCH JUL/23

- Prepare the website for deployment on a reliable hosting platform.
- Perform final checks and optimizations for security and performance.
- Launch the e-commerce website for public access.

THANK YOU!

- The **"Foodzy Food Ordering Web Application Using MERN Stack"** project has been an exciting journey in building a robust and user-friendly online food ordering platform.
- Through the MERN stack, we successfully integrated front-end and back-end technologies, providing a seamless user experience.
- This project marks a significant milestone in our journey towards embracing cutting-edge technologies and creating meaningful web applications.
